The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers anable the production of the full length cDNA easily without any special methods. The present sequence is the nucleotide sequence of the 5'-end of a cDNA provided in the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     una provided in the invention. Note: The sequence of the S'-end of not form part of the printed specification, but was obtained in CD-format directly from BPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            830 Primers useful for synthesizing full length cDNA clones and their use

```

The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special

830 Primers useful for synthesizing full length cDNA clones and their use

genetic manipulation.

This invention comprises the cDNA and protein sequences of an isolated protestasin-like serine protease and reagents and methods for requlating the human prostasin-like enzyme activity. Prostasin is a trypsin-like serine protease is useful for immunodetection and ingnosis of micro-metastases, autoimmune lesions and renal failure in biopsy specimens, plasma samples and body fluids. The antibody may be used to modulate enzyme activity in a disease, such as metastasis of malignant cells, tumour angiogenesis, inflammation, chronic obstructive pulmonary disease (COPD), atheroscierosis, neurodegenerative disease (e.g. prion protein amyloid plaques of Genstmann-Straussles Syndrome, creutzfeldt-Jakob disease, Scrapie) or infection, particularly viral infection. The human prostasin-like serine protease gene provides a chimic, in particular for treates and protein ample of decreasing human protease gene provides a chimic, in particular for treates and protease and protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protein ample of the protei
                                                                                                                                                                                                                                                                                                                                                                                       Novel human prostasin-like serine protease polypeptide and polynucleotide which can be regulated for treating metastasis of malignant cells, inflammation, atherosclerosis, neurodegenerative disease and infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         activity, in particular for treating or preventing metastatic cancer. The agonists and antagonists of the nucleotide sequence may be used to mimic, augment and inhibit the enzyme activity which may be useful to treat osteoporosis, Paget's disease and degradation of bone implants particularly dental implants. Altered levels of human prostasin-like serime protease activity inhibits both smooth muscle cell proliferation and lipid accumulation and inhibit the progression of restenosis and atherosclerosis. The nucleic acid sequence is also useful in diagnostic assays for detecting diseases and abnormalities or susceptibility to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            diseases related to the presence of mutations in nucleic acid sequences which encode the enzyme. The present sequence represents the human prostasin-like serine protease #2 nucleotide sequence of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Disclosure; Fig 3; 111pp; English

Claim 1; SEQ ID NO 6883; 103pp; English

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGN) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed sequence tags for identifying expressed cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations diagnostics for sense types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The present sequence encodes a human secreted polypeptide. The secreted polypeptides and polymucleotides are useful for treating nervous and muscular diseases, for inhibiting tumour formation and metastasis, for treating gastrointestinal ulceration, for preventing and treating diseases in spinal cord, thyroid gland, ovary, prostate, renal gland, consmall intestine, heart, trachea, thymus, lymph node, muscular system and colon, for treating lipase deficiency in cystic fibrosis and paraction, during angioplasty and all surgical procedures that require decreased blood clot formation, for treating liver diseases, coagulation disorders and microbial diseases, for treating lineametion and transplant rejection, for enhancing bone thickness and increasing bone density, for reducing the loss of essential ferroxidases, for suppressing apoptosis, and for regulating vascular smooth cell proliferation. They may also be used as vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      GGAGGTGGCCACATCTGCGGGGGGCTCCCTCATCGCCCCCTCCTGGGTCCTCTCCGGCTGCT 120

isolated from a range of human tissues disclosed in the specification.
The nucleic acids, proteins, antibodies and (ant)agonists are useful in
the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and
ovarian cancer and other cancers of the adrenal gland, bone, bone marrow,
breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune
alegancies e.g. Addison's disease, allergies, autoimmune haemolytic
anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease,
multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c)
cardiovascular disorders such as wiral, bacterial, fungal and epilepsy; and (f)
infections. Note: The sequence data for this patent did not form part of
the printed specification, but was obtained in electronic format directly
from WIPO at ftp.wipo.int/pub/published_pct_sequences

Sequence 8899 BP; 1841 A; 2663 C; 2617 G; 1778 T; 0 U; 0 Other;

The present sequence is a coding sequence for a NOV protein. The NOV proteins and coding sequences are useful for treating or preventing NOV-associated disorders or in the manufacture of a medicament for treating the disorders, such as cancer, heart disease, inflammation, autoimmune disorders, allergies, blood disorders, AIDS, diabetes, obesity, asthma, IGA nephropathy, cirrhosis, arthritis, Alzheimer's disease, infections (e.g. bacterial, viral, parasitic), stroke, muscular dystrophy, epilepsy, and other wasting disorders associated with chronic diseases. NOVI4b is a prostasin-like protein, and the NOVI4b coding sequence localises to

NOVX polypeptides and encoding polynucleotides, useful for preventing or treating NOVX-associated disorders e.g. cancer, inflammation, or Alzheimer's disease, and in chromosome mapping, tissue typing or

```

or

The present sequence is a coding sequence for a NOV protein. The NOV proteins and coding sequences are useful for treating or preventing NOV-associated disorders or in the manufacture of a medicament for treating the disorders, such as cancer, heart disease, inflammation, autoimmune disorders, allergies, blood disorders, AIDS, diabetes, obesity, asthma, IGA nephropathy, cirrhosis, arthritis, Alzheimer's disease, infections (e.g. bacterial, viral, parasitic), stroke, muscular dystrophy, epilepsy, and other wasting disorders associated with chronic diseases. NOV14a is a prostasin-like protein, and the NOV14a coding sequence localises to chromosome 16pl1.2 Sequence 1726 BP; 284 A; 581 C; 499 G; 362 T; 0 U; 0 Other;

is a subtracted library derived from NCI CGAP_Sub4. The
NCI CGAP_Sub5 library had 3 million recombinante. A
single-stranded DNA preparation of NCI CGAP_Sub4 was used
as a tracer in a subtractive hybridization with a driver
comprising the IMAGE pool (IMAGE CloneIDs
1322376-1323911, 1456008-1456775,1500552-1502855);

/clone lib-ray derived from the UT-R-CO
polylinker; Site_l: Not I; Site_2: Ecc RI; The UT-R-CO
library is a subtracted library derived from the UI-R-CO
mixture of individually tagged normalized libraries
constructed from tat placenta, adult lung, brain, liver,
kidney, heart, spleen, ovary, and muscle: The UT-R-EI
library consisted of a mixture of individually tagged
normalized libraries constructed from 8, 12 and 18-day
normalized libraries constructed from 8, 12 and 18-day
normalized libraries constructed from 8, 12 and 18-day
normalized libraries constructed from 8 a follows identification of the library of origin of a clone
allows identification of the library of origin of a clone
within the mixture. The subtracted library (UI-R-CO) was
constructed as follows: PCR amplified constructed to
been derived was used as a driver in a hybridization with
the pooled UI-R-AI and UI-R-EI clones from which 3' ESTS had
been derived was used as a driver in a hybridization of
single-stranded circles. The remaining single-stranded
circles (subtracted library) was purified by
hydroxyapatite column chromatcgraphy, converted to
double-stranded circles and electroporated into DH10B
bacteria (Life Technologies) to generate the UI-R-CO
library. This procedure has been previously described
(Bonaldo, Lennon and Soares, Genome Research 6: 791-806,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AA996811

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymuclectide kinaes. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pMDA2 (gil 4732114/gbl AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XIII0-Gold (Stratagene) cells and selected for ampicillin resistance."

/clone lih="Spitheline poly (A+ RNA was dephosphorylated with bacterial alkaline phosphatase (BAP) and then decapped with tabacco acid pyrophosphatase (TAP). The decapped with tabacco acid pyrophosphatase (TAP) and then decapped with tabacca acid pyrophosphatase (TAP). The decapped with tabacca ware ligated and the first including Sfil site by treatment of T4 RNA ligase and the first strand cDNA was synthesized with Superscript II using Sfil cloned into DraIII- digested pwm185-Fil3 vector. The cloned into DraIII- digested pwm185-Fil3 vector. The obtained cDNA vectors were used for transformation of competent cells E. coll Top10F' by electroporation method. The CDNA libraries constructed by this method are full-length enriched cDNA library."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
